

A process, recorded in context.

Fictional pre-owned yacht acquisition | 1-20 September 2026 | Prepared 28 September 2026

What this example demonstrates

The connection between a participant, an action, a document version and its recorded time. The accompanying JSON and verifier demonstrate change detection using example hashes and a demo Ed25519 signature.

Participants and recorded review scope

Alex Morgan | Buyer representative

alex@example.test | DEMO check recorded | DEMO mandate reviewed

Sam Lee | Seller representative

sam@example.test | DEMO check recorded | DEMO ownership and authority review

Jordan Bell | Buyer counsel

jordan@example.test | DEMO check recorded | DEMO professional credentials reviewed

Taylor Reed | Marine surveyor

taylor@example.test | DEMO check recorded | DEMO appointment and credentials reviewed

Scope

The text files are fictional placeholders, not real contracts or certified translations. Participant checks, credentials, devices and times are invented. This PDF is a readable specimen; the kit verifies the JSON and example files, not a production PDF artifact seal.

FICTIONAL DATA. NOT A PRODUCTION EVIDENCE EXPORT.

The chronological record.

From invitation to inspection. All entries below are fictional.

Verify integrity. Understand scope.

A file can be changed. Protected content should fail verification against the original trusted references.

1. Recompute document hashes

Compare each included file against the hashes covered by the record.

2. Recompute the event chain

Check the content digest, previous-event link and sequence. This demo uses its own educational format, not the production signing-event formula.

3. Verify the protected body and signature

The supplied script checks the pinned example root and Ed25519 signature against a pinned demo key. Do not replace the trusted key with one supplied by an untrusted sender.

4. Validate an independent timestamp in a real pack

A real review must check the RFC3161 token, message imprint, TSA certificate chain and applicable trust policy. This demonstration has no TSA token.

5. Read the limits

Device and IP metadata do not prove the identity of a human operator. Integrity does not establish truth, legal sufficiency, complete capture or the absence of unrecorded actions.

Run the downloadable educational kit

Unzip example-record-kit.zip. Use Python with the cryptography package available, then run the command below from that folder. The script performs local file checks only.

```
python3 verify-example.py example-record.json
```

Expected result

PASS for the educational chain, pinned digest, demo signature and document files. NOT PRODUCTION EVIDENCE remains explicit because no real checks, participant credential proofs or independent timestamp are present.

Tamper test: work on a copy of the JSON and change the project title. The verifier must return FAIL. A production review additionally validates the supported pack format, independently trusted keys and timestamp materials. Never treat a green demonstration as certification of a real transaction.
